To anyone it may concern,

Re: Filt-Air Systems Implementation at IDF

1. Filt-Air treatment module D6 Duct Unit (IP3-025V-21) was installed in the HVAC duct system within strategic briefing halls that must remain operational at all times, regardless of possible COVID-19 threats.
2. The system proved to be essential in the mitigation of COVID-19 contagiousness, enabling those who are in charge to assemble all the required professionals in a way that enhances the effectiveness of decision making processes in the face of the Coronavirus pandemic.
3. In particular, the system's effectiveness came to notice on one occurrence in which an infected COVID-19 individual attended a meeting, did not keep a safe distance and used no protection measures, and yet, there was no spread of the virus to the other participants.
4. The IDF opted for the cheaper, stand-alone, Filt-Air Sterionizer SA unit (IP7-012D-31) for the offices of decision makers that must be kept active and effective for the purpose of maintaining national security.
5. The IDF's experience with Filt-Air systems was indeed a good one, in all aspects, from the purchasing experience, through installation and QC, to maintenance.
6. The provided systems were stripped of Wi-Fi and other transmitters, and were adjusted to uphold the cybersecurity requirements of the IDF.
7. We found Filt-Air to be thoroughly professional, with high availability, very communicative and efficient, but most importantly – they offer an extremely good product.

Sincerely Yours,

Eran Tuval, Lt. Col.
Head, Materials & Chemistry Dept.
